[Chrome Enable Separate Process For Each Tab Mac](#)

When the button was clicked again, a new text editor process will start And in the mainwindow I'll have some logic to hide the inactive process to make it looks like a tab.. Will this setup work?. Hi, this is the idea I have for now: I'll create a mainwindow program and text editor program.. Here is an amazing news I read about Firefox Jan 7, 2018 - Once the browser is, each browser tab is allocated a separate process so that the crash in one web page doesn't damage other unrelated tabs.. When the button was clicked, it'll trigger a slot that start the text editor program with qprocess, and then set the geometry to make it looks like it was attaching to the mainwindow.

In the mainwindow program, it'll have qsharedmemory and qprocess and a button and the text editor program will have qsharedmeomory as well.. How to enable a separate process per tab in Firefox I always keep a watch on Firefox's latest nightly builds as all the cool new features land there first.
